TECHNICAL REPORT GL-90-7

### MAINTENANCE MANAGEMENT SYSTEM

by

Joseph Banks, Jan Coester, Peter Graziano

DeLeuw, Cather and Company Engineering Management Services Division Gaithersburg, Maryland 20879

June 1990 Final Report

Approved For Public Release; Distribution Unlimited

Prepared for US Army Corps of Engineers Engineering Housing Service Center Fort Belvoir, Virginia 22060-5516 Under Contract No. DACA39-87-M-0999

Monitored by Geotechnical Laboratory
US Army Engineer Waterways Experiment Station
3909 Halls Ferry Road, Vicksburg, Mississippi 39180-6199

#### **PREFACE**

This report documents the development of maintenance planning guidelines for routine pavement maintenance at US Army installations. This work was sponsored by US Army Corps of Engineers, Engineering Housing Service Center (EHSC) and performed for the US Army Corps of Engineers, Waterways Experiment Station (WES), under Contract No. DACA39-87-M-0999. The EHSC Technical Monitor was Ken Gregg.

Information on existing pavement maintenance operations was obtained by the Principal Investigators conducting on-site visits and data collection at Fort Leonard Wood, Fort Bliss, Fort Devens, Fort Stewart, Rock Island Arsenal, and Sierra Army Depot. Personnel from the Office of the Chief of Engineers, Washington, DC, provided information on the work management and contracting procedures being used by the Corps of Engineers. The Tri-Service Manual, "Maintenance and Repair of Surface Areas," TM 5-624/NAVFAC MO-102/AFM 85-8, provided the basic framework for the maintenance and repair procedures of the maintenance planning guidelines. References to TM 5-624 are made throughout the planning guidelines.

Appreciation is extended to the Corps of Engineers personnel at the Army installations visited, especially, Sierra Army Depot's assistance in developing the illustrative maintenance work program. Contributions and assistance provided by other Corps of Engineer contacts are also appreciated.

The study was conducted under the general supervision of Dr. W. F. Marcuson III, Chief, Geotechnical Laboratory (GL); Messrs. H. H. Ulery, Jr., Chief, Pavements Systems Division (PSD), GL; J. W. Hall, Jr., Chief, Engineering Investigations, Testing, and Validation Group, PSD; and L. N. Godwin, Chief, Materials Research Center, PSD. This report was produced under the direct supervision of Dr. R. S. Rollings, Chief, Materials Research and Construction Technology Branch, PSD. Mr. Timothy Vollor was the WES Technical Monitor.

Commander and Director of WES during the preparation of this report was COL Larry B. Fulton, EN. Dr. Robert W. Whalin was Technical Director.

## CONVERSION FACTORS, NON-SI TO SI (METRIC) UNITS OF MEASUREMENT

Non-SI units of measurement used in this report can be converted to SI (metric) units as follows:

| Multiply    | By       | To Obtain        |
|-------------|----------|------------------|
| acre        | 0.40469  | hectare          |
| acre        | 0.00405  | square kilometer |
| cubic feet  | 0.02832  | cubic meter      |
| cubic yard  | 0.76464  | cubic meter      |
| feet        | 0.30480  | meter            |
| gallon      | 3.78532  | liter            |
| inch        | 0.02540  | meter            |
| mile        | 1.60934  | kilometer        |
| pound       | 0.45359  | kilogram         |
| square feet | 0.09290  | square meter     |
| square yard | 0.83613  | square meter     |
| ton (U.S.)  | 907.1848 | kilogram         |
| ton (U.S.)  | 0.90718  | metric ton       |
| yard        | 0.91440  | meter            |
|             |          |                  |

#### GLOSSARY OF TERMS

#### Contract Maintenance

The use of private contractors to perform routine maintenance work.

#### Daily Production

The amount of work expressed in work units accomplished during a standard work day using the recommended work procedure, personnel, equipment and materials.

#### Inventory Unit of Measure

The pavement feature and unit of measure, e.g. bituminous lane mile, ditch mile.

#### Maintenance Item

Feature of the pavement system top be maintained, e.g. bituminous surface, unpaved shoulder, traffic sign. Also referred to as pavement item.

#### Maintenance Management System (MMS)

A method for planning, organizing, directing and controlling routine pavement maintenance and other operations.

#### Planning Guideline

The documentation for each work activity that provides the recommended work procedure and resources required to perform the work activity in an effective and economical manner.

#### Routine Maintenance

The minor repair, preservation and upkeep of pavement items to provide a safe, smooth and structurally sound pavement.

#### Work Activity

The type of maintenance work that is performed on each maintenance item or feature of the pavement; e.g., crack sealing, full-depth patch, machine mowing, plow runways.

#### Work Unit of Measure

The measurement unit used to plan annual work quantities and to report daily work accomplished for a work activity, e.g., tons, square yards, miles, acres.

#### Work Procedure

A series of work tasks required to complete a whole job with a single measurable output. Typically performed by a crew of work team.

#### MAINTENANCE MANAGEMENT SYSTEM

#### PART I: SUMMARY

- 1. The Corps of Engineers recognized the need for army installations to have a maintenance system to manage the routine, day-to-day pavement maintenance work not included in the pavement management system (PAVER). Maintenance management systems encompass the full management cycle of planning, organizing, directing and controlling.
- 2. The initial effort in the development of a maintenance management system for pavements involved the following three tasks:
  - <u>a</u>. Identify pavement items or components to be maintained, such as bituminous pavement, concrete pavement, unpaved shoulders, ditches, traffic control markings and other features.
  - <u>b</u>. Identify maintenance work activities associated with each pavement item.
  - <u>c</u>. Develop planning guidelines for identified maintenance work activities.

The pavement items, activities and guidelines had to be adaptable to any installation of the Department of the Army. Therefore, information on pavement maintenance operations and requirements was collected at six army installations that represented different missions, climates, terrains and sizes.

- 3. US Army technical manuals provided the basic information. Information from implemented maintenance management systems at the national, state and local government levels was also utilized.
- 4. The identified pavement items, work activities and planning guidelines represent requirements on a regional or national basis, as opposed to a specific installation. The intent was to define a sufficient number to accommodate army installations throughout the United States.
- 5. <u>Maintenance items</u>. The physical features of the pavement systems requiring routine maintenance were identified and given a unit of measure for inventory purposes. Maintenance features include bituminous surface, unpaved surface, unpaved shoulders, traffic signs, ditches and other items.
- 6. <u>Maintenance work activities</u>. Sixty-four (64) work activities related to the maintenance items were also identified. Example work activities are pothole patching, crack sealing, epoxy patching, patch paved

shoulder, runway sweeping and repair signs. A work unit was selected for each activity to measure the output produced by a maintenance crew, for example, tons of material placed, square yards of surface patched, road miles graded and number of signs repaired. Work measurement was kept simple not to burden field workers with calculations and paper work.

- 7. <u>Planning guidelines.</u> A planning guideline was developed for each work activity. The guidelines contain a recommended work procedure and the labor, equipment and materials resources required to economically accomplish quality work. Typical daily crew production is also provided. The planning guidelines reflect current field maintenance practices for army pavement systems and can be easily modified for use at a specific installation where deviation from typical practice is warranted and necessary.
- 8. <u>Demonstration program and budget</u>. Planning guidelines and other information were used to develop a routine maintenance work program and budget for Sierra Army Depot, one of the six installations visited. This demonstrated the potential for further development and implementation of maintenance management for pavements at army installations.

#### **Findings**

- 9. Findings address the management of routine maintenance for pavements at US Army installations.
  - <u>a</u>. An annual quantified program of routine maintenance work is not provided to the first line supervisor.
  - <u>b</u>. Current maintenance evaluation reports do not include quantities of accomplished work current reporting focuses on resources.
  - <u>c</u>. Current resource estimates for activities are "built up" from detailed tasks by craft. Frequently, these estimates have minimum value to the first-line supervisor in scheduling, mobilizing crews and performing work.
  - <u>d</u>. Reports on person-hour usage and costs do not provide the firstline supervisor information required to effectively direct and control field operations.
  - e. A significant portion of routine and cyclic maintenance is performed by contract. The absence of planning guidelines and annual work estimates limits the effectiveness of contracts and gives little direction for contract management.
  - <u>f</u>. There are areas where a management system for routine pavement maintenance would enhance PAVER, as well as other information support for first-line supervisors. Example areas are annual

work planning, job estimating, resource requirements and work history.

#### Recommendations

- 10. The following recommendations are made for developing the additional components of a routine pavement maintenance management system for the US Army Corps of Engineers.
  - a. The complete maintenance management cycle of planning, organizing, directing and controlling be developed and implemented for the pavement systems at a minimum of two pilot test locations with emphasis on work and support of first-line supervisors.
  - <u>b</u>. Pilot test development and implementation efforts be interfaced with PAVER for inventory, annual work quantity planning and possibly routine maintenance history by pavement section.
  - <u>c</u>. Existing informational systems be utilized as data input for planning and organizing routine pavement maintenance operations.
  - d. Available national maintenance management system (MMS) software be utilized to develop the planning, organizing, directing and controlling components of MMS for routine pavement maintenance, as demonstrated for Sierra Army Depot for planning.
  - e. Planning guidelines developed for routine pavement maintenance be utilized to better estimate resource and work requirements in-house hand work requirements for contracts.

#### PART II: INTRODUCTION

#### Why Develop a Maintenance Management System

- 11. The pavement management system, entitled PAVER, identifies pavement repair and rehabilitation needs. Pavement strategies are determined at the network and project level and tend to be cyclic improvements. The Corps of Engineers developed PAVER which has been implemented successfully by several Army, Air Force and Navy installations. Additionally, PAVER has been adopted by the American Public Works Association (APWA) and implemented in various cities and counties throughout the United States.
- 12. The Corps of Engineers recognized the need to have a pavement maintenance management system to manage the routine, day-to-day, maintenance work activities not included in PAVER. The maintenance management system includes the full management cycle of planning, organizing, directing and controlling.

#### Components of Phase One

- 13. As the first step in the development of a pavement maintenance management system specific components of the management system were developed during this project. These components included the following:
  - <u>a</u>. Pavement items, or features, of the pavement system to be included.
  - $\underline{\mathbf{b}}$ . Maintenance work activities associated with each pavement item.
  - <u>c</u>. Planning guideline for each identified maintenance work activity.
- 14. The elements of the maintenance management system developed during this project provides the framework for subsequent phases of development and implementation. The pavement maintenance management system for routine maintenance work encompasses pavement maintenance not included in PAVER and provides management support for the complete scope of work performed on pavements.

#### Designated Work Tasks

- 15. The initial effort in the development of a pavement maintenance management system involved three (3) designated work tasks. These tasks were:
  - a. Identify pavement items of the pavement systems to be included. These are the pavement components to be maintained, such as bituminous pavement, concrete pavement, unpaved shoulders, ditches, traffic control markings and other features.
  - **b**. Identify maintenance work activities associated with each pavement item.
  - <u>c</u>. Develop planning guidelines for identified maintenance work activities.
- 16. Maintenance and repair techniques in the Tri-Service Manual, Maintenance and Repair of Surface Areas, TM 5-624/NAVFAC MO-102/AFM 85-8 were designated to be followed in the development of pavement maintenance planning guidelines. This manual provides guidance for the maintenance and repair of roads, streets, parking areas, airfields, walks and other pavement areas at the Army, Air Force and Navy installations.

#### US Army Installations Visited

- 17. Since the maintenance management system was to be adaptable to any of the Department of Army installations in the United States, information on pavement maintenance operations and requirements was to be collected at army installations that represented different missions, climates, terrains and sizes.
- 18. Two (2) installations were selected from each of the three major commands responsible for the majority of the pavement surfaces at army installations. The following installations were selected for on-site visitation and in-depth data collection on pavement maintenance operations:
  - <u>a.</u> <u>FORSCOM</u> Forces Command Fort Devens, h. ssachusetts Fort Stewart, Georgia
  - <u>b</u>. <u>TRADOC</u> Training and Doctrine Command Fort Bliss, Texas Fort Leonard Wood, Missouri
  - <u>c</u>. <u>AMC</u> Army Materials Command Rock Island, Arsenal, Illinois Sierra, AD, California

These six (6) installations provided good geographic distribution with varying terrains, climates and sizes. Figure 1 shows this distribution.

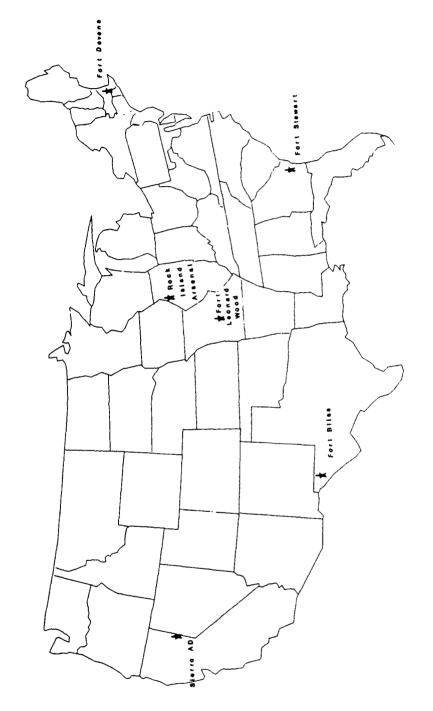

Figure 1. Army Installations Visited

#### PART III: STUDY APPROACH

#### Existing Maintenance Information

- 19. Current pavement maintenance operations by the Corps of Engineers provided the starting point in the development of a pavement maintenance system. The joint Departments of the Army, the Navy and the Air Force, USA, Technical Manual TM 5-624/NAVFAC MO-1021/AFM 85-8, Maintenance and Repair of Surface Areas provides guidance for the maintenance and repair of roads, streets, parking areas, walks and airfields. The manual discusses the types of surfaces and materials, causes and types of distress and different methods of maintenance and repair. The information in this manual presents a good overview of the scope of pavement maintenance, but it is not organized into maintenance work activities or planning guidelines. However, it provided an excellent base for developing an initial list of maintenance items and work activities.
- 20. Another source on pavement maintenance is the joint Department of the Army, the Navy and Air Force handbook of Engineered Performance Standards for Real Property Maintenance Activities TB 420-22/NAVFAC P-712.0/AFM 85-51 that cover roads. This handbook provides guidance in estimating person hour requirements for workers to perform typical facilities maintenance tasks. However, for roads only five task areas, work activities, are listed. Within each task area the work performed is broken down into minute work units for estimating person hour requirements. Separate estimates are made for individual work steps. Typical work steps for "Replacing Bituminous Surface" include operate pneumatic hammer, remove broken material, sweep area, apply tack coat, place bituminous material and hand tamp. This type of detail may be beneficial for planning and evaluating selected type of maintenance work but has not proven effective, or required, for planning and evaluating routine pavement maintenance work performed on a day-to-day basis.
- 21. The American Public Works Association (APWA) manual, Street and Highway Maintenance Manual, contains detailed information on pavement maintenance operations and performance standards for selected maintenance work activities. Several cities and counties have utilized this manual to assist them in developing and implementing a maintenance management system for their agency.

- 22. Other sources of existing information on maintenance management systems include state and local transportation agencies throughout the United States and national agencies, such as the National Park Service which has developed a servicewide maintenance management system that is being implemented in over 300 parks throughout the nation. This system encompasses roads, trails, walks, grounds and all physical features of the park that must be maintained.
- 23. These existing sources of maintenance management information were utilized to develop initial lists of maintenance items and work activities.

#### Installation Visits

- 24. Installation visits were coordinated through the Directorate of Engineering and Housing (DEH) at each installation. A key contact person responsible for pavement maintenance was identified and arrangements finalized for an on-site visit to review pavement maintenance operations at the installation.
- 25. Prior to the installation visits the preliminary lists of pavement maintenance items work activities developed from existing information was transmitted to the installation, together with draft definitions for each work activity that describe the type of work included in each work activity. An agenda of subjects to be covered during the installation visit was also provided to the maintenance contact. These subjects included:
  - a. Current budgeting and work planning process.
  - b. Work reporting forms and procedures.
    - (1) Labor, equipment and materials.
    - (2) Work accomplished.
  - **c**. Available inventory of pavement maintenance items (features to be maintained).
  - d. Personnel and equipment available for maintenance.
  - e. Types and magnitude of pavement maintenance performed.
    - (1) DEH personnel.
    - (2) Troops.
    - (3) Commercial contract.
  - <u>f</u>. Labor, equipment and materials used to perform specific work activities.

- 26. The preliminary lists of maintenance items and work activities were reviewed during the installation visits and modified to reflect pavement maintenance requirements at the installation being visited. The level of work effort normally associated with each work activity was recorded as high, medium or low. Additionally, it was determined whether the maintenance was performed with in-house personnel, commercial contract or a combination of both.
- 27. The Commercial Activity (CA) process, which involves routine maintenance being performed by private contractor, was very active at the installations visited. One installation was performing all pavement maintenance by a private contractor and another was scheduled to start complete contractor pavement maintenance on April 1, 1988. At the other installations private contract maintenance effort ranged from major to minor. Routine maintenance work typically being contracted includes traffic line striping, roadside mowing and crack/joint sealing. Cyclic type of maintenance such as resurfacing, seal coating and pavement rehabilitation are also normally contracted.
- 28. PAVER, the pavement management system being implemented by the Corps of Engineers was found to be in varying levels of implementation at the six installations. PAVER was fully implemented and being utilized at two installations; implementation was underway at two locations; and two installations had not initiated implementation efforts. PAVER is being operated by a private contractor at one installation and by DEH personnel at the other location. Personnel at these locations were complimentary of PAVER application as an objective rating of pavement condition to develop cyclic maintenance projects.
- 29. Field observations of maintenance work in progress and items to be maintained were made at the installations to ensure the maintenance items and work activities identified during this phase were representative of pavement facilities at the army installation. Pavement surface types observed included bituminous concrete, portland cement concrete, gravel and dirt. One unique feature found on army installations was the concrete tank crossings and intersections on bituminous roads, however, the maintenance requirements are the same as other concrete surfaces. Snow and ice control activities for airfield facilities differ from roadways due to aircraft movements and the prohibition of corrosive-type chemicals. The majority of the activities had been

identified on the preliminary listings and were confirmed during the installation visits.

30. Pavement maintenance at army installations is performed by the Roads Branch of DEH. Staffing for pavement maintenance at two installations has decreased significantly in the last ten (10) years. In terms of paved lane miles per person, staffing at these two locations is low compared to the other two installations performing pavement maintenance with in-house personnel. The equipment available at the installations included the types typically required to perform pavement maintenance and was well maintained.

#### PART IV: MAINTENANCE MANAGEMENT ELEMENTS

#### Maintenance Workload Planning

- 31. Maintenance workload planning is the first step in a comprehensive maintenance management system encompassing routine maintenance. It is based on the physical features to be maintained, maintenance work to be performed and resources (labor, equipment and materials) required to accomplish the planned maintenance workload. The identification of these basic maintenance management planning elements for pavement systems formed the overall objective for the first phase of maintenance management system development.
- 32. The maintenance management planning elements developed reflect the routine maintenance needs and requirements of the pavement systems at US Army installations. The elements identified represent requirements on a regional or national basis, as opposed to a specific installation. The intent was to define a sufficient number of the individual planning elements that would accommodate army installations throughout the United States. The following planning elements were developed.
  - a. Maintenance items.
  - b. Maintenance work activities.
  - c. Maintenance planning guidelines.

#### Maintenance Items

- 33. Maintenance items are features of the pavement system requiring routine maintenance work. The types and amounts of routine maintenance to be performed at each army installation depend on the types of pavement features to be maintained at each installation. A typical army installation's inventory of maintenance items includes features such as:
  - a. Bituminous surface.
  - b. Unpaved surface.
  - c. Unpaved shoulder.
  - d. Mowable roadside.
  - <u>e</u>. Traffic sign.
- 34. The quantity of the maintenance item is expressed as units of measure for each feature. For example:

- a. Bituminous surfaces are measured by lane miles.
- b. Unpaved surfaces are measured as road miles.
- c. Unpaved shoulders are measured by shoulder miles.
- d. Mowable roadsides are measured in acres.
- e. Traffic signs are counted (each).

Figure 2 shows the maintenance items and units of measure that were identified as being applicable for pavement facilities at army installations. The maintenance item and unit of measure that most directly affect the amount of routine maintenance work required are designated for each maintenance work activity to be performed at the installation.

#### Maintenance Work Activities

- 35. The maintenance workload planning process is work activity oriented. A maintenance work activity is defined as a task or related tasks performed by maintenance personnel work as a team or crew to accomplish a specific single measurable result. Each type of work that uses a definite mix of labor, equipment and materials is defined as a separate work activity. For example, in surface maintenance, a work activity called "patching" is too general for good workload planning. Surface maintenance can involve pothole patching with hand tools and major full-depth patching with excavating equipment. Each is a separate work activity because the team composition (man/machine mix) and measurable results are different.
- 36. Work activities were identified for the major categories of pavement items to be maintained and specific services to be provided for these features. The major categories selected for maintenance work activities are:
  - a. Bituminous pavement.
  - b. Concrete pavement.
  - c. Other surfaces.
  - d. Shoulders.
  - e. Roadside.
  - f. Drainage.
  - g. Bridge surface.
  - h. Traffic services.
  - i. Snow and ice control.

#### Maintenance Item

Linear Feet

Figure 2. Maintenance items and unit of measurement

Specific work activities were identified for each category. A total of 64 work activities was selected for routine pavement maintenance at army installations. Figure 3 lists the work activities for each category.

- 37. For each work activity a work unit was selected to measure the work performed by maintenance personnel. The work unit also is used to plan the total workload for each work activity. Typical work units include tons of material placed, square yards of surface patched, road miles bladed and number of signs repaired. The work unit should describe the results of the work effort and be practical and easy to measure. The field crew doing the work should be able to measure and record the amount of work with minimal effort. For some work activities, the work unit is best expressed as person hours. This is the case for work activities such as "Hand Mowing and Trimming" and "Remove Roadway Debris". It is difficult, if not impossible, to identify a work unit that is practical and reasonable to measure and is representative of the nature of the work. The work units for each work activity are shown in Figure 3.
- 38. Work activities and their measurement units are directly related to inventory units to facilitate planning maintenance workloads. The relationship of the work to the inventory unit is shown in Figure 3.
- 39. The work activity name identifies the work, but is not necessarily fully descriptive of the work. For each work activity a general description of the work was prepared that further defines the work to be performed, the deficiency to be corrected, reasons for doing the work and the result to be achieved. The description should leave little doubt about what work is included in the activity. Figure 4 illustrates the activity descriptions. A complete list is contained in Appendix A.

#### Maintenance Planning Guidelines

40. One of the basic objectives of a maintenance management system is to ensure effective and economical use of labor, equipment and materials in the performance of pavement maintenance activities. This is accomplished, in part, by developing planning guidelines for planning and organizing work according to the work methods and resources established to perform the work activities in an effective and economical manner. An important requirement is

| WORK   | ACTIVITY                    | WORK UNIT       | MAINTENANCE UNIT AND ITEM (Inventory Unit)  |  |  |  |
|--------|-----------------------------|-----------------|---|--|--|--|
| BITUMI | NOUS PAVEMENT               |                 | Lane Mile Bituminous Surface Lane Mile Concrete Surface Lane Mile Unpaved Surface Road Mile Unpaved Surface |  |  |  |
| 1110   | Pothole Patching            | Tons            | Lane Mile Bituminous Surface  |  |  |  |
| 1120   | Partial-Depth Patch         | Tons            | Lane Mile Bituminous Surface  |  |  |  |
| 1130   | Full-Depth Patch            | Tons            |   |  |  |  |

Figure 3. Pavement Maintenance Work Activities (Continued)

#### MAINTENANCE WORK ACTIVITY DEFINITIONS

#### **BITUMINOUS PAVEMENT**

#### 1110 Pothole Patching

Patching small areas (25 sq. ft., or less) of bituminous surfaces with asphalt material to correct abrupt depressions, potholes, edge failures and other potential surface hazards to provide a smooth paved surface.

Work Unit:

Tons Asphalt Concrete

Inventory Unit:

Bituminous Lane Mile

#### 1120 Partial-Depth Patch

Removal and replacement of large areas (more than 25 sq. ft.) of failed bituminous surfaces excluding the base course to provide a smooth, structurally sound pavement surface and to eliminate safety hazards.

Work Unit:

Tons Material

Inventory Unit:

Bituminous Lane Mile

#### 1130 Full-Depth Patch

Removal and replacement of large areas (more than 25 sq. ft.) of failed bituminous surfaces and base courses to provide a smooth, structurally sound pavement surface and to eliminate safety hazards.

Work Unit:

**Tons Material** 

Inventory Unit:

Bituminous Lane Mile

#### 1140 Surface Treatment Patch

Patching small areas (25 sq. ft., or less) of bituminous surfaces with one or more applications of hot liquid asphalt and aggregate to correct extensive cracking, raveling, spalling and shallow surface failures to restore surface and prevent further deterioration.

Work Unit:

Square Yards

Inventory Unit:

Bituminous Lane Mile

#### 1150 Surface Treatment

Placement of surface treatments on sound bituminous surfaces to seal cracks, correct minor surface depressions and to provide a new wearing surface.

Work Unit:

Square Yards

Inventory Unit:

Bituminous Lane Mile

Figure 4. Sample Maintenance Work Activity Definitions

that the guidelines are practical and easily communicated to first-line supervisors and field crews.

- 41. Planning guidelines support work program and budget development by providing the framework for estimating the labor, equipment, materials, and the expected daily productivity for each activity. The guidelines also provide information about:
  - a. What work is to be done.
  - b. When the work is to be done.
  - c. Why the work is to be done.
  - d. What basic work steps are to be done.

These data, for each activity, support managers and supervisors in their efforts to maximize the use of limited resources in accomplishing maintenance work programs.

- 42. Planning guidelines were developed for each identified routine maintenance work activity. These guidelines have been developed from data abstracted from the Army's Manual, "Maintenance and Repair of Surface Areas" (TM 5-624), interviews and work observations at the six installations visited and planning guideline data available from other sources such as the American Public Works Association and the National Park Service. Information contained in the planning guidelines are representative of routine pavement maintenance operations and sound maintenance practices. The guidelines reflect current maintenance practices for army pavement systems and could be modified for use at a specific installation with minimal effort.
- 43. Planning guideline data are presented in a format as shown in Figure 5. Descriptions of the information included in each planning guideline are presented in the following sections:
  - <u>a.</u> <u>Work activity.</u> The title of the maintenance work activity as shown on the activity list.
  - $\underline{b}$ .  $\underline{Code}$ , A numeric identification code as shown on the activity list.
  - c. <u>Description</u>. The narrative description of work to be performed and results to be achieved.
  - <u>d</u>. <u>Maintenance item</u>. The pavement item to be maintained and its unit of measure.
  - e. <u>Planning criteria</u>. Information about when to schedule work, and additional guidance about the severity of the deficiency or priority of the work. Other important scheduling or coordination information may also be presented. The monthly section

|------------|-----------------------|---|---------|----------|
|            |                       | RECOMMENDED WORK PROCEDURE                                      |         |          |
| 1.         | Use truck warni       | ing lights and other traffic controls as required.              |         |          |
| 2.         | Mark area to be       | e removed at least six inches beyond the damaged area.          |         |          |
| <b>3</b> . | Saw or jack har       | mmer around the marked area.                                    |         |          |
| 4.         | Square the edg        | es to provide a vertical face on the area to be patched.        |         |          |
| <b>5</b> . | Remove all loos       | se debris from area to be patched.                              |         |          |
| <b>6</b> . | Level and comp        | pact the base.  |         |          |
| <b>7</b> . | Make sure the a       | area is dry. Use heater-blower if necessary.                    |         |          |
| 8.         | Spray tack light      | ly on bottom and sides of area to be patched.                   |         |          |
| 9.         | Place and rai tamper. | ke premix in layers not exceeding 2 inches, compacting          | each la | yer witl |
| 10.        | Check with stra       | ight edge to make sure patch is level with surrounding surface. |         |          |
|            |                       |   |         |          |
|            |                       | ENGINEERED PERFORMANCE STANDARD                                 |         |          |

Figure 5. Planning Guideline (Continued)

6.00000 Hours per Ton

- provides an indication of the typical calendar distribution of the work activity.
- f. Resources requirements personnel. The numbers and types of personnel required to perform the work are listed. Specific personnel classifications have not been used. Titles related to work assignments and required skills have been used instead for these performance standards. Quantity is based on average conditions for flagging and materials hauling. Personnel may be added or deleted to satisfy special traffic, safety, or hauling requirements.
- g. Resource requirements equipment. The major types of equipment and the number required to perform the work are listed. The lack of availability of a specific type of equipment may require a substitution. The material haul distance for a specific work site may affect the actual number of trucks required.
- h. Resource requirements material. The major materials typically required to perform the work are shown. Requirements may vary depending on the type of deficiency to be corrected.
- i. <u>Daily production</u>. The estimated amount of work to be accomplished in an 8 hr day using the recommended work procedure, crew, equipment and materials. This estimate is presented in terms of a quantity of work units and is shown as a range recognizing that day-to-day accomplishments will vary.
- j. <u>References methods and safety.</u> Technical references for manuals, specifications, standards, safety criteria and other information to be considered in planning the work activities.
- k. Recommended work procedure. On the back of the performance standard is a recommended work procedure to follow when planning and accomplishing the work. These procedures may be modified to fit a specific work location or condition. However, the basic steps should be performed to ensure the deficiency is corrected properly and/or the desired quality of workmanship is obtained.
- 1. <u>Engineered performance standard</u>, Person-hours per unit of work accomplishment.
- 44. Appendix B contains the planning guidelines developed for the pavement maintenance work activities identified during this phase of maintenance system development. These planning guidelines will not apply uniformly at all army installations due to variations in factors such as terrain, weather, installation size, installation missions and available labor, equipment and material resources. As required, these guidelines can be modified to develop installation-specific planning guidelines which address the individual installation situation.

45. The resource requirements for personnel, equipment and caterial should represent the most effective and efficient complement of resources to accomplish each work activity. Resources, and quantities, shown on the planning guidelines represent average conditions and actual use may vary to satisfy special work site locations. Appendix C contains the resource lists for personnel, equipment and material classifications used in the planning guidelines and the measurement units used for the resource.

#### PART V: ANALYSIS AND DEMONSTRATION

46. Current use of maintenance management principles and the potential for application of a comprehensive maintenance management system were reviewed and analyzed. This analysis was not directed toward an audit of existing maintenance operations and work management procedures, as only six (6) army installations were contacted and visited on site. However, these installations were selected as being representative of the army installations throughout the United States.

#### Existing Routine Maintenance Operations

- 47. Routine maintenance work for pavement systems is performed by in-house personnel, by private contractors and by a combination of both. The annual work program and budget for routine pavement is included in the Operations and Maintenance portion of the Annual Work Program (AWP) for the installation. The AWP does not identify every project to be performed during the year, but rather is a planning document which reflects the best information available when the work program is developed.
- 48. The maintenance work program consists of estimated personnel and material costs for standing operations, service orders, individual jobs/projects and emergency work as well as private contract work. Equipment requirements typically are estimated as a separate line item in the budget. These estimates are based on historical data, field inspections and other identified needs. The annual routine maintenance work program does not appear to be based on accomplishing a designated amount (quantity) of routine maintenance--except when the commercial activity (CA) process is involved.
- 49. The CA process involves identifying and quantifying the specific types of routine maintenance work to be performed during the year. Sufficient detail is provided to permit private contractors to bid on performing the work. The Facilities Engineer also prepares a bid to perform the routine maintenance work with in-house personnel. A private contractor must bid more than 10 percent less than the in-house bid in order to receive the contract for the routine maintenance work. At the two installations where private contractors had been awarded contracts for routine maintenance, the roads and

pavement maintenance personnel appeared to have minimal input into the in-house bid for the pavement maintenance portion.

- 50. Work authorization, or organizing and directing, is provided through three (3) separate categories of work: service orders, standing operations orders and individual job orders.
  - <u>a. Service Orders (SOs).</u> Small service-type maintenance and repair jobs not exceeding 16 person-hours of labor and \$350 material costs. Includes emergencies and work requiring immediate action.
  - b. Standing Operations Orders (SOOs). Work of a continuing, year-around basis such as utility plant operations or custodial services. Road and pavement maintenance usually is not performed by SOO except for repetitious type work performed during certain months, such as snow removal operations.
  - c. <u>Individual Job Orders (IJOs)</u>. All maintenance and road repair work involving more than 16 person-hours and \$350 material costs, but not in excess of the installation commander's approval authority.

Proper use of these categories provides an effective work authorization and organization component for maintenance management.

- 51. IJO resource estimates are not performed by maintenance operations personnel, but rather by planner-estimators using Engineered Performance Standards (EPS) on a task-by-task basis or general person-hour estimates based on experience. Engineered Performance Standards are the estimated number of person-hours required to accomplish a certain unit of work according to a specified method and to an acceptable quality. A recognized limitation in using EPSs for estimating routine pavement maintenance work is that only a limited number of EPSs are available. Field personnel at the installations visited indicated there were wide variations in estimated resources on IJOs and the resources actually required to perform the work. There were doubts on how the estimated resources were developed.
- 52. Routine pavement maintenance does not lend itself to a rigid, mechanistic application of industrial engineering principles for measuring work production. This was recognized over 25 years ago by the professionals pioneering the development and application of maintenance management concepts. Typically, work production is expressed as "average daily production" for a compliment of resources (labor, equipment, materials) to accomplish during a standard work day. The work performed includes all the separate work tasks (work activity) required to produce the completed whole job with a single unit

of measure performed by a team or crew. The reasons for this approach were twofold. First, administrative and management costs needed to be kept in line with the costs of performing the work. Second, procedures had to be simple for effective communications at the working level.

- 53. Priorities are assigned to SOs and IJOs as they are received and approved for work assignment. Various work scheduling approaches were used by the installations visited. These approaches ranged from formal weekly schedules to daily scheduling/work assignments. The key factors affecting maintenance scheduling seemed to be installation size and supervisory personnel preference.
- 54. Reporting of maintenance work accomplished varied among the installations contacted. Some used the phase and task codes of the Integrated Facilities System (IFS). Others had developed their own task codes that grouped the individual tasks involved in completing a work function (activity). In some cases, work accomplishment was reported in measurable work units for each task. All installations used the form Labor and Equipment (DA FORM 4288) to report labor and equipment used.
- 55. Installations with an IFS have the capability to develop several standard evaluation reports including the following:
  - <u>a</u>. Labor and Equipment Report Daily list of work performed by person for all SO, WO, JO.
  - <u>b</u>. SO Backlog Report Lists backlog of Service Orders by task code and priority.
  - $\underline{\mathbf{c}}$ . S00 Shop Schedule Report Shows estimated person-hours versus completed person-hours.
  - d. Projects-in-Progress Schedule Status of IJOs.

Pavement maintenance personnel indicated these reports were of limited use to them in evaluating their work efforts. The reports did not list work accomplishment or cost per unit of work and the reports were not always current. Some supervisors prepared manual evaluation reports.

#### Application of Maintenance Management Elements

#### Maintenance management overview

56. Maintenance management systems provide a formalized process and procedures for managing maintenance operations for various facilities such as pavements, roads, parks, utilities and buildings. Although the magnitude of

the maintenance workload varies from area to area, the same procedures are adaptable to installations of all sizes and with differing responsibilities. The four major functions of maintenance management systems are:

- a. Planning.
- b. Organizing.
- c. Directing.
- d. Controlling.

These are systems that focus on the field work and first-line supervision and have capability to summarize for higher levels of management.

- 57. Maintenance management elements are developed to reflect the maintenance requirements and conditions at the specific installation. Maintenance management provides managers and supervisors with effective procedures to manage and control their maintenance responsibilities. Microcomputers are often used to store relevant maintenance data, perform calculations and prepare reports. By eliminating the need for tedious, time consuming manual tasks, the maintenance staff is available to perform important field direction and other maintenance wash.
- 58. The planting, organizing, directing and controlling functions are shown in the maintenance management flowchart in Figure 6. Each function has several components which are integral to maintenance management systems.
- 59. <u>Planning.</u> The planning function provides a work program and budget that reflects management decisions and objectives for maintenance activities. This process includes the development of several planning elements that are organized and compiled to form a work program and budget. These elements are:
  - a. Organization data.
  - b. Work activities.
  - c. Inventory and condition assessment.
  - d. Planning guidelines.
  - e. Service levels\*
  - f. Resources and unit costs.

Work activities and performance standards for pavements at army Installations have been developed during this study.

60. Organizing. As shown in Figure 6, the organizing elements are:

<sup>\*</sup> Frequencies of maintenance work or annual quantities of maintenance work per unit of inventory.

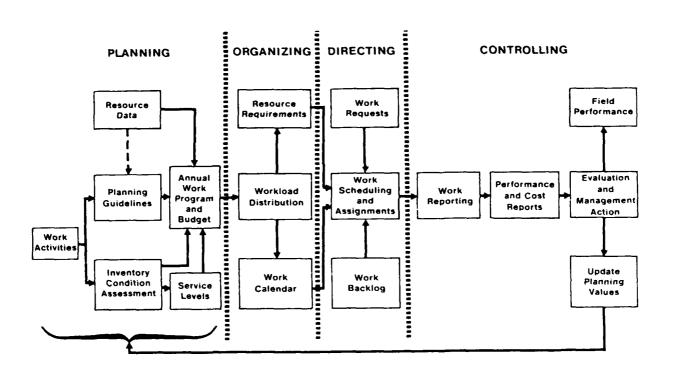

Figure 6. Basic Maintenance Management Information Flow

- a. Workload distribution.
- b. Work calendar.
- c. Resource requirements.

Workload distribution procedures are used to allocate the total annual work program to the months the work will or should be performed. The need for staffing to match seasonal workload variations is readily apparent from this process. A work calendar to be used for preparing short-term schedules is provided. The monthly requirements for labor, equipment and materials needed to do the annual work program are identified.

- 61. <u>Directing.</u> The work directing function involves identifying and documenting work needs, preparing short-term work schedules and assigning work to the maintenance staff. These elements involve the use of:
  - a. Work calendar status reports.
  - b. Work requests and backlog reports.
- <u>c</u>. Knowledge of other factors affecting maintenance activities. These work directing procedures assist the managers and supervisors in their efforts to accomplish the work program objectives in an efficient and cost effective manner.
- 62. <u>Controlling</u>. The work controlling function consists of monitoring the progress of work performed in comparison to the plan and taking action to direct or redirect future efforts. Procedures are provided for collecting, evaluating and using work performance data reported by field maintenance personnel. Work performance and cost reports are available for managers and supervisors to use in analyzing and evaluating maintenance work efforts in their respective areas of responsibility.
- 63. Maintenance management systems (MMS) provide detailed documentation of the maintenance workload and help identify when specific activities should be performed. MMS allows the work program to be easily modified when funding availability or other conditions change. MMS provides guidance in scheduling work and provides more timely and useful information to maintenance managers.
- 64. Maintenance management systems are designed to assist maintenance managers in their efforts to plan, organize, direct and control the maintenance program. It is a tool for managers to use in setting objectives, preparing programs, and carrying out those programs. Maintenance management is a work management system with associated cost data.

#### Sierra Army Depot Demonstration

65. Unless pavement maintenance data and planning guidelines are used to assist managers in more effectively accomplishing the maintenance mission, the value of expending effort to collect or develop this data is questionable. Therefore, a methodology for using this data to develop an annual maintenance program which will assist the managers in planning, organizing, directing, and controlling scarce resources to perform pavement and grounds maintenance is presented for the Roads and Grounds Branch of the Buildings, Grounds and Utilities Division of the Directorate of Engineering and Housing, Sierra Army Depot. The program which was developed is based on information provided by the Depot but is only representative of their operations and is not intended to depict, accurately, their current financial or operating programs.

#### Maintenance management principles involved

- 66. Focused Management. All of the work activities performed by the Roads and Grounds Branch were identified. Then using the principle of the "vital few versus trivial many" shown in Figure 7, those activities which required the most effort, money or management were selected to be included in the program as specific activities. The remainder of the activities were grouped into appropriate "General" activities in the work program. As a result of this selection process, the numerous bituminous pavement activities performed were included in the activity, General Bituminous Maintenance, because no one bituminous maintenance activity was large enough to single out for managerial emphasis. As Sierra, this is due to the large contract maintenance and repair program currently underway which reduces the amount of work performed on pavements by the in-house staff. The identification of the "Vital Few" activities focuses the managers attention in those areas where improvements or degradations in performance will significantly affect the overall program.
- 67. <u>Performance based</u>. Planning an annual work program is most effective if the planning effort is based on the type and amount of work to be accomplished. Identification of the total amount of a work activity to be performed upon the entire inventory during the year provides the basis for a rational approach to the allocation and distribution of resources necessary to accomplish that work. Realistic planning guidelines for the individual work

Management Should Focus Its
Attention to the "Vital Few" Activities -Instead of the "Trivial Many"

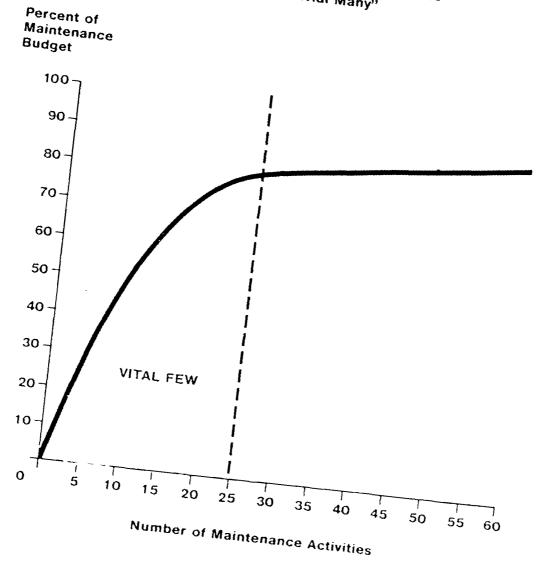

Figure 7. The Importance of the "Vital Few" Activities Within the Maintenance Budget

activities based on the use of expected resources simplifies the determination of the amount, cost and time distribution of resources required to accomplish a year's amount of work.

### Planning-developing the work program and budget

- 68. <u>Selection of Work Activities</u>. The work activities listed in Figure 3, Part IV, provided the basis for selecting the work activities for Sierra Army Depot. From the total list of 64 routine maintenance work activities, 20 were selected. An additional 6 activities for railroads, landfills, supervision and administration were selected. An additional 6 activities for railroads, landfills, supervision and administration, 20 were selected. An additional 6 activities for railroads, landfills, supervision and administration were selected to account for the total work performed by the Branch. Six of the activities are "General" activities which combine the numerous small activities performed. The list of the selected activities with the appropriate work and inventory units is shown in Figure 8.
- 69. <u>Identification of the maintenance inventory</u>. Based on the inventory units of the selected work activities, an inventory of the Depot was conducted from records. (For the purposes of this demonstration program the inventory is very approximate.) As can be seen the detail of inventory required to plan the maintenance program is determined by the selected significant work activities. This inventory is shown in Figure 9. As will be shown later this inventory is divided into detail locations for work reporting.
- 70. <u>Determination of service levels</u>. A service level for a work activity is the amount of work (stated in the appropriate work unit) to be performed on an unit of inventory during the year. For example, if each acre of ground is to be moved 12 times during the year, the service level for the work activity-grounds moving would be 12 acres per acre. The annual work program for any work activity is simply the service level multiplied by the amount of inventory.
- 71. The service levels for the work activities at Sierra Army Depot were determined through discussions with the appropriate foremen in the Roads and Grounds Branch. Ideally, these service levels would be based on a determination of the condition of the inventory. These service levels would reflect the amount of work required to bring the inventory into a desired

|      | WORK ACTIVITY         | INVENTORY UNIT                | WORK UNIT       |

Figure 9. Sierra Army Depot Road Inventory

state of maintenance. Of course, in the real world, the resources required to achieve this state are seldom available so it is necessary to revise the desired service level to a planned service level achievable with the available resources. The difference between the desired and the planned service levels provides the basis for the quantification of the amount of maintenance which must be deferred.

- 72. <u>Using the planning guidelines</u>. The planning guidelines developed for the project provide the basis for determining the quantity and types of resources required to perform the amount of work in the annual work program. At Sierra Army Depot the developed planning guidelines were modified to reflect the available resources, the actual organization of crews and the production expected under the local working conditions. This data determined the number and the cost of the crew days to accomplish the annual work program. A compilation of this data for each work activity into one report is called the Work Program and Budget Report. The Work Program and Budget for Sierra Army Depot is shown in Figure 10.
- 73. Work program and budget report. The Work Program and Budget Report represents the product of the planning process. This report compiles and summarizes management decisions and objectives relative to the kinds and amounts of work to be planned; the productivity of the work force; and the costs of the planned work. These are key elements in the process of managing the routine pavement maintenance effort. Figure 10 shows the Work Program and Budget Report developed for Sierra to demonstrate the application of the planning elements. The following items explain in the data in the report.
  - a. Activity. The code and name of the work activity.
  - <u>b</u>. <u>Feature inventory</u>. The quantity and unit of the inventory item used in planning the activity.
  - <u>c</u>. <u>Planned service level</u>. The planned service level in terms of the number of work units per each unit of inventory.
  - <u>d</u>. <u>PCT of DES</u>. The value indicating that portion of the desired service level that is included in the planned work program.
  - <u>e</u>. <u>Annual work quantity</u>. The planned annual work quantity -- the product of the feature inventory, the service and it is stated in terms of the work unit for the activity.
  - f. Average daily production. The estimated average daily production established for the activity. It is used to calculate the estimated crew days required for the work. This number is divided into the annual work quantity.

Figure 10. Example Work Program and Budget Report for Sierra Army Depot

- g. <u>Crew size</u>. This is the estimated average crew size to be assigned to the work activity.
- h. <u>Person days.</u> The estimated number of person days needed to perform the work on the activity. It is the product of the crew size times the crew days.
- i. Cost distribution. The estimated annual cost of labor, equipment, and materials/other for the activity. These costs are calculated by multiplying the cost per crew day for labor, equipment and materials/other times the planned crew days.
- j. <u>Total cost</u>. The total cost of labor, equipment and materials/ other for the activity.
- k. <u>Totals</u>. These values represent the sum of the person days, labor, equipment, material/other, and total costs for all activities.
- 1. Overhead percent of labor. The additional calculated cost to reflect a budget additive as a function of the total labor cost. This additional cost is not reflected in the individual activities.
- m. Overhead percent of total. The additional calculated cost to reflect a budget additive as a function of the total cost. Note--in the example, there is no total overhead cost shown.
- n. <u>Total budget</u>. The estimated total cost to perform the planned work for the management unit, including any overhead additives.
- 74. Deferred maintenance report. The planned maintenance work program represents planned annual maintenance based on budgetary limits or available resources. The initial work program and budget calculations are made with the desired service levels (related to unconstrained requirements), or quantities of work that should be performed for optimum service. Adjustments are made in the desired service levels for selected work activities and are reflected in the planned service levels. The deferred maintenance report is a comparison of the work program derived from the desired and planned service levels. For each of the two programs the annual work quantities and total costs are displayed. The difference between these programs is calculated and displayed as deferred maintenance. With these data maintenance managers can readily identify the volume of work that is not included in the planned work program. The deferred maintenance report developed for Sierra is shown in Figure 11. The following items explain the data presented in the report.
  - a. Activity. The code and name of the activity.
  - <u>b</u>. <u>Feature inventory</u>. The quantity and unit of the inventory item used in planning the activity.

Figure 11. Example Deferred Budget for Sierra Army Depot

- c. <u>Desired program</u>. The annual work quantity and total cost based on the desired service level.
- <u>d</u>. <u>Planned program</u>. The annual work quantity and total cost based on the planned service level.
- e. PCT. This is the ratio of the planned to desired work plan and indicates what percent of the desired service level is being planned. A 100 signifies that they are the same. A number less than 100 indicates a lower level of service was planned than was desired.
- <u>f.</u> <u>Deferred maintenance.</u> The difference between the desired and planned programs in work quantity and cost. Usually, the planned program will be less than the desired. However, in cases where the planned values are greater than desired, the deferred maintenance values will be shown as negatives.
- g. <u>PCT</u>. The percent of the desired program that is not included in the planned program.
- h. <u>Totals</u>. Three total cost values are provided. These represent the sum of all costs for desired, planned and deferred programs. Percent values are calculated and shown for planned and deferred costs.

#### Work organizing

- 75. <u>Workload distribution</u>. The planned annual work program is distributed among the months that the work typically is performed. An example workload distribution report for Sierra is shown in Figure 12. Total person days by months are distributed for each work activity.
- 76. Work calendar. The work calendar shows the planned maintenance on a monthly basis for standard crew days. Figure 13 illustrates the work calendar for Sierra. This report serves as a guide to the supervisor for when specific work should be scheduled.
- 77. Resource requirements. Labor, equipment and material resource requirements are summarized by each resource classification used in the planning process. Monthly requirements are compiled and compared to available resources. These reports assist in decisions regarding staffing, equipment needs and materials procurement. The labor requirements report can be very helpful in determining the needs for temporary personnel, contract assistance, or overtime work to accomplish peak or seasonal workloads. Figure 14 shows the labor summary report developed for Sierra. The following items describe the information shown in this report.
  - a. Labor resource. The code and name of the labor classification.
  - $\underline{\mathbf{b}}$ . Inventory. The number of these labor types assigned to the management unit.

Figure 14. Example Labor Requirements Reports for Sierra Army Depot

- c. Availability. The estimated percent of time that the labor resource is available for work.
- d. <u>Person days by month and total</u>. The sum of all person days required for those activities specifying this labor type.
- <u>e</u>. <u>Total cost</u>. The estimated annual cost of this labor class, derived by multiplying the days required by the respective hourly rates.
- f. Average number staff required. Represents the average number of persons required in this labor class for each month and an annual average. It is derived by dividing the person days required by the average person days per person per month and the availability percent.

Similar reports are available for equipment and material resources. Work controlling

- 78. The last component of the complete maintenance management system consists of reporting work accomplishment and evaluating the actual and planned work accomplishment and costs. Work reports completed by field personnel record work accomplished and related use of labor, equipment and materials. These data are entered into the computerized work data files. Various evaluation and performance reports are available for maintenance managers and field supervisors to use in analyzing and evaluating the progress toward the planned work programs. These reports present key information concerning work accomplishments, costs and resource use. Two of the work evaluation reports were prepared for the demonstration data at Sierra Army Depot. These were the Performance Report and the Location Maintenance Report.
- 79. <u>Performance report</u>. A comparison of planned and actual work performance is provided for five key elements of each work activity -- person days, work accomplishment, average daily production, total cost. Figure 15 illustrates the format and content of this report.
- 80. Location maintenance report. Routine maintenance work for pavements is not planned by individual route or road section, but by an overall organizational unit. However, actual costs and work performed by unique road section or locations are often required by management for other purposes. The pavement location used by PAVER to assess pavement conditions were input into the sample data used to demonstrate MMS application at Sierra. Figure 16 is an example of a location maintenance report using these data.

#### Identify maintenance repairs

81. Identified maintenance repairs are primarily cyclic-type maintenance, such as overlays, seal coating and surface replacement. However, other

Figure 16. Example Location Maintenance Report

identified repairs include crack filling, patching, grinding, grooving, joint filling and other repairs usually considered routine maintenance.

82. The type of routine maintenance repairs identified by PAVER are included as maintenance activities in maintenance management systems for work planning, organizing, directing and controlling. Maintenance management does not include an automated assessment of pavement condition to identify maintenance needs, but inputs these requirements as service levels, or quantity standards, which are developed from external sources. Routine maintenance repairs identified from PAVER are a logical input into the annual work planning component of a maintenance management system.

#### Maintenance feature condition

- 83. The condition of maintenance features to be maintained is used to determine where and how much work is needed to maintain the features at a level consistent with policies and priorities of the agency. Because planned maintenance often depends on the condition of a specific feature, an up-to-date condition assessment is necessary. This assessment of feature conditions provides the basis for preparing a maintenance work program that reflects the actual conditions of the features to be maintained.
- 84. Army installations with implemented PAVER systems have a complete inventory and condition assessment of pavement surfaces. This information is on a section-by-section basis and is updated periodically. The PAVER condition data can be used very effectively to develop planned service levels for pavement surface activities.

#### Contract Maintenance

#### Management responsibility

85. Pavement maintenance by contract relieves the governmental agency of some of the management responsibility associated with the actual performance of the work and mobilization of the necessary resources. Responsibility for organizing and directing the labor forces is assigned to the contractor. The agency retains responsibility for planning the maintenance and controlling work quality. Some directing and scheduling responsibility also remains with the agency. Figure 17 shows the respective management responsibilities for maintenance by contract and maintenance by governmental agency forces.

Figure 17. A Comparison of Management/Supervision Functions for In-House and Contracted Maintenance Work

86. Effective maintenance planning and work control are vital to a successful contract maintenance or commercial activity process. Successful contracting must begin with adequate planning and be supported by managers experienced in contract maintenance control. Management control involves the types and quantities of work scheduled and performed, as well as the quality of work performed. Work control must be linked to the field work for successful contract management.

#### Planning and control

- 87. Maintenance management systems offer work planning and control components for managing routine day-to-day maintenance. Planned work is based on features of the physical assets to be maintained and the level of service, or work quantity, to be provided for the assets. Work quantities can be incorporated into the Request for Bid to private contractors. Comparable bids for designated quantities of work would be obtained from private contractors as well as in-house staff.
- 88. Work control consists of monitoring the progress of maintenance performed in comparison to the planned work, or the maintenance contract for private contractors. Work performance and cost reports are provided for assessing and controlling maintenance work efforts.

#### PART VI: FINDINGS AND RECOMMENDATIONS

#### **Findings**

#### Existing information systems

- 89. The US Army has developed several automated information systems to provide assistance to DEH's in planning and controlling construction and maintenance work on facilities and physical features. The Integrated Facilities Systems (IFS) is one of the most comprehensive automated information and evaluation systems developed. IFS has been implemented at several installations throughout the commands during the past 10 years. IFS has been revised, expanded and improved during this period and is currently being adapted to function on micro/minicomputer hardware (IFS-M). This will provide a more user-friendly, better integrated and more flexible environment to serve the operational and information needs of the individual installations.
- 90. An objective of IFS-M is to establish a standardized "core" facilities engineering data base that provides the minimum data set to support DEH management and reporting requirements. Existing systems to be integrated with IFS-M include:
  - <u>a</u>. Facilities Engineering Job Estimating (FEJE).
  - b. Facilities Engineering Supply System (FESS).
  - c. Job Order Contracting System (JOC).

A long-range plan is to also interface PAVER with IFS-M. The intent of IFS-M is to support a broader and higher level of maintenance planning and control through the standardized "core" da base. It is not intended to satisfy the more detailed planning and controlling requirements of first-line supervisors. These types or requirements are often unique to each installation and require a level of detail not intended for IFS-M. Consequently, predictive maintenance models such as PAVER, RAILER and ROOFER are being introduced.

#### Routine in-house maintenance

91. Components of IFS-M, PAVER and other support systems used by DEH do not encompass the routine day-to-day maintenance requirements for pavements. Frequently, individual job orders do not reflect resource requirements to accomplish the work. Short-term or job evaluation reports comparing inconsistent resource estimates with actual resource usage often have little meaning to field supervisory maintenance personnel.

92. The absence of an annual work program for routine pavement maintenance precludes having evaluation reports which indicate longer-term cumulative progress toward annual work objectives.

#### Contract maintenance

93. The absence of structured, organized quantitative information for routine pavement (and other) maintenance also impacts contracting such activities. The scopes of selected current contracts were reviewed. The scope mixed inventory, some quantitative frequency and qualitative considerations for routine maintenance activities. Annual work and resource estimates were not systematically included. Consequently, the contractor and the installation staff are faced with significant uncertainty with regard to work and required resources.

#### Recommendations

- 94. The planning guidelines developed as a result of this project characterize routine pavement maintenance activities as whole jobs of work having a single measurable output performed by a crew functioning as a team according to a specified work procedure or method. This total or holistic approach to defining the activities best reflects what actually takes place in the field.
- 95. It is recommended that these guidelines be used as a basis for estimating resource requirements for individual routine pavement maintenance jobs. In practice, this estimating technique is simple, efficient and provides sufficient accuracy for management control.
- 96. It is also recommended that the planning guidelines be issued to first-line supervisors as a guide to mobilizing crews to perform the work. This should improve efficiency in daily crew mobilization, as well as, the setting of short-term schedules.

## Application of maintenance management in-house

97. The principles of maintenance management are directly applicable to the US Army pavement systems. Maintenance items, work activities and planning guidelines were identified and developed for routine pavement maintenance during Phase 1. To further demonstrate their management utility for an army installation, these planning guidelines and other planning values were applied

to the pavement system of the Sierra Army Depot to establish an annual work program and performance budget.

- 98. Based on information from the six installations visited and existing information systems supporting routine maintenance, there is potential for improved work management procedures for routine and cyclic pavement maintenance which cover the full management cycle of planning, organizing, directing and controlling, particularly in support of the first-line supervisor.
- 99. Army installations with implemented PAVER systems have a complete inventory and condition assessment of pavement surfaces. The PAVER condition data can be used to develop planned work for pavement surface activities. Routine maintenance repairs identified from PAVER can also be used to estimate annual work quantities for selected activities and supplemented with results of this project.
- 100. In light of the above, it is recommended that a full-cycle routine pavement maintenance management system covering planning through controlling be developed and implemented at a minimum of two pilot test installations. The system should be characterized by the following:
  - a. Emphasis on information support for first-line supervisors.
  - $\underline{b}$ . Focus on work and work quantification.
  - c. Capacity to readily link annual work programs to resource estimates.
  - $\underline{\mathbf{d}}$ . Utilization of inventory and work estimates from PAVER for those activities covered by PAVER.
  - $\underline{\mathbf{e}}$ . Capability to report routine history by pavement section to PAVER.
  - $\underline{\mathbf{f}}$ . State-of-the-art microcomputer operation sufficiently generic to accept nonpavement routine maintenance activities in the future.

Such system would be consistent with the new operating environment planned for IFS-M. It would focus on efficiencies at the level where the work is performed and information support for first-line supervisors. Routine maintenance is primarily a decentralized activity. The opportunity for efficiencies occur at the working level. The same system should also be capable of supporting contract maintenance.

#### Contract maintenance

101. Maintenance management systems are applicable to maintenance performed by in-house personnel, by private contractor or both. The workload

planning component can be used to quantify the maintenance workload included in commercial activities as well.

- 102. It is recommended that programs (scopes) for routine maintenance contracts (initially for the pavement portions) include:
  - a. Annual estimates of work by month by activity.
  - b. Annual resource estimates by type by month.

The objective would not be to absolutely tie the contractors' hands, but to quantify the maintenance, thereby reducing the uncertainty associated with these types of maintenance operations. The quantification of scope and resources and distribution throughout the year (identifying peaks and valleys) should result in both lower bids and higher profits for contractors through improved resource utilization.

103. It is recommended that the same full-cycle management system support contract maintenance. The management functions supported under contracting are indicated in Figure 17. Although less overall management functions are required under contracting, certain functions should remain exclusively with the installation staff and others performed jointly to keep the contractor on tract. The demonstration at the Sierra Army Depot is indicative of the kind of planning that is equally applicable to contract maintenance.

#### APPENDIX A: MAINTENANCE WORK ACTIVITY DEFINITIONS

## U.S. ARMY CORPS OF ENGINEERS Maintenance Management System

#### **BITUMINOUS PAVEMENT**

1110 Pothole Patching

Patching small areas (25 sq. ft. or less) of bituminous surfaces with asphalt concrete material to correct abrupt depressions, potholes, edge failures and other potential surface hazards to provide a smooth paved surface.

Work Unit:

**Tons Asphalt Concrete** 

Inventory Unit:

Bituminous Lane Mile

1120 Partial-Depth Patch

Removal and replacement of large areas (more than 25 sq. ft) of failed bituminous surfaces excluding the base course to provide a smooth, structurally sound pavement and to eliminate safety hazards.

Work Unit:

**Tons Asphalt Concrete** 

**Inventory Unit:** 

Bituminous Lane Mile

1130 Full-Depth Patch

Removal and replacement of large areas (more than 25 sq. ft.) of failed bituminous surfaces and base courses to provide a smooth, structurally sound pavement surface and to eliminate safety hazards.

Work Unit:

Tons Material

Inventory Unit:

Bituminous Lane Mile

1140 Surface Treatment Patch

Patching small areas (25 sq. ft. or less) of bituminous surfaces with one or more applications of hot liquid asphalt and aggregate to correct extensive cracking, raveling, spalling and shallow surface failures to restore surface and prevent further deterioration.

Work Unit:

Square Yards

**Inventory Unit:** 

Bituminous Lane Mile

#### 1150 Surface Treatment

Placement of surface treatments on sound bituminous surfaces to seal cracks, correct minor surface depressions and to provide a new wearing surface.

Work Unit:

Square Yards

Inventory Unit:

Bituminous Lane Mile

#### 1160 Skid Resistance Treatment

Placement of porous friction surface materials on bituminous surface to increase skid resistance and reduce hydroplaning on pavement surfaces.

Work Unit:

Square Yards

**Inventory Unit:** 

Bituminous Lane Mile

#### 1170 Crack Sealing

Placement of crack sealant into cracks on bituminous surfaces to prevent water entry and related damage to the surfacing and base materials.

Work Unit:

Gallons Sealant

Inventory Unit:

Bituminous Lane Mile

#### 1180 Treat Bleeding Asphalt

Placement of hot sand or aggregate on bleeding or flushing bituminous surfaces to absorb the film of bituminous material on the surface and to restore surface friction.

Work Unit:

Square Yards

Inventory Unit:

Bituminous Lane Mile

#### 1190 Treat Fuel Spillage

Treatment of areas subjected to moderate fuel spillage with fuel resistant sealers to reduce the leaching way of the asphalt binder and subsequent raveling of the surface aggregate.

Work Unit:

Square Yards

Inventory Unit:

Bituminous Lane Mile

#### **CONCRETE PAVEMENT**

#### 1310 Bituminous Patching of PCC Surface

Bituminous patching of small (25 sq. ft. or less) portland cement concrete (PCC) surface areas that require immediate repair to correct spalled areas, abrupt depressions and other potential surface hazards to provide a smooth paved surface.

Work Unit:

Tons Asphalt Concrete

Inventory Unit:

Concrete Lane Mile

#### 1320 Partial-Depth Patch of PCC Surface

Removal and replacement of large (more than 25 sq. ft.) areas of failed portland cement concrete (PCC) surfaces excluding the base course to provide a smooth, structurally sound surface and to eliminate safety hazards.

Work Unit:

Square Yards

Inventory Unit:

Concrete Lane Mile

#### 1330 Full-Depth Patch of PCC Surface

Removal and replacement of large (more than 25 sq. ft.) areas of failed portland cement concrete (PCC) surfaces and base courses as required to provide a smooth, structurally sound surface and to eliminate safety hazards.

Work Unit:

Square Yards

Inventory Unit:

Concrete Lane Mile

#### 1340 Epoxy Patching

Patching spalled areas and shallow surface defects in portland cement concrete pavements with epoxy grout, mortar and concrete materials to prevent water entry and further deterioration.

Work Unit:

Square Yards

Inventory Unit:

Concrete Lane Mile

#### 1350 Bituminous Undersealing

Injection of liquid bituminous material under portland cement concrete pavements to fill and prevent the enlarging of minor voids under the pavement surface.

Work Unit:

Square Yards

**Inventory Unit:** 

Concrete Lane Mile

#### 1360 Crack/Joint Sealing

Placement of adhesive material into joints and cracks on portland cement concrete pavements to prevent the entry of water and foreign matter and related damage to the surfacing and base materials.

Work Unit:

Linear Feet

Inventory Unit:

Concrete Lane Mile

#### 1370 Slab Replacement

Removal and replacement of entire portland cement concrete pavement slabs, including the base courses as required to provide a structurally sound surface capable of supporting the required loads.

Work Unit:

Square Yards

Inventory Unit:

Concrete Lane Mile

#### 1380 Slabjacking

Pumping of grout mixtures through holes cored in portland cement concrete pavements into void areas under the pavement to raise and realign the pavement slab by filling the void areas.

Work Unit:

Square Yards

**Inventory Unit:** 

Concrete Lane Mile

#### 1390 Slab Grinding

Grinding of concrete portland cement pavements to level and realign faulted areas between slabs or cracks within the slab by grinding the high side.

Work Unit:

Square Yards

**Inventory Unit:** 

Concrete Lane Mile

#### 1400 Surface Grooving

Grooving portland cement concrete pavements by cutting a series of small grooves or cuts in the pavement surface to improve the surface skid resistance.

Work Unit:

Square Yards

Inventory Unit:

Concrete Lane Mile

#### **OTHER SURFACES**

#### 1510 Blade Unpaved Surface

Blading, reshaping and smoothing unpaved surfaces, without adding material or widening, to restore crown, proper shape, drainage and smooth riding surface. Includes pulling and cleaning roadside ditches and sloping of shoulders as required.

Work Unit:

Road Miles

Inventory Unit:

**Unpaved Road Miles** 

#### 1520 Add Gravel to Unpaved Surface

Repairing and stabilizing unpaved surfaces by adding granular materials. Includes reshaping and compacting to correct ruts, potholes, washouts, corrugations and to restore crown, proper shape, drainage and a smooth riding surface.

Work Unit:

**Road Miles** 

**Inventory Unit:** 

**Unpaved Road Miles** 

#### 1530 Cement/Lime Stabilization

Application of cement or lime mixtures to unpaved surface materials and mixing with water. Includes reshaping and compacting to provide proper cross-section, drainage and a smooth riding surface.

Work Unit:

Road Miles

Inventory Unit:

Unpaved Road Miles

#### 1540 Dust Control

Application of dust control materials on unpaved surfaces to control dust and to minimize detrimental effects on personnel, equipment and aircraft.

Work Unit:

Road Miles

Inventory Unit:

**Unpaved Road Miles** 

#### 1550 Blade Troop Trails

Blading, reshaping and smoothing unpaved troop trails to remove vegetation and restore crown. Includes adding aggregate as necessary to maintain shape and integrity of trail.

Work Unit:

Trail Miles

Inventory Unit:

Troop Trail Miles

#### **SHOULDERS**

#### 1710 Patch Paved Shoulders

Patching of paved shoulders with asphalt concrete material to correct abrupt depressions, edge failures and other potential surface hazards to provide a smooth paved surface.

Work Unit:

Tons Asphalt Concrete

Inventory Unit:

Paved Shoulder Miles

#### 1720 Seal Coating

Seal coating of paved shoulders with hot liquid asphalt and cover aggregate to correct extensive cracking and spalling, prevent further deterioration and to provide an impervious surface.

Work Unit:

Square Yards

Inventory Unit:

Paved Shoulder Miles

#### 1730 Blade Unpaved Shoulders

Blading and reshaping unpaved or stabilized turf shoulders on paved roads to eliminate edge ruts, washouts, ridges, corrugations and high, overgrown shoulders. Includes major cutting and grading to restore proper shoulder slope for adequate drainage.

Work Unit:

**Shoulder Miles** 

Inventory Unit:

**Unpaved Shoulder Miles** 

#### 1740 Add Gravel to Unpaved Shoulders

Repairing unpaved shoulders on paved roads by adding granular materials. Includes reshaping and compacting to correct ruts, potholes, washouts, corrugations and to restore proper shoulder slope for adequate drainage.

Work Unit:

Tons Material

Inventory Unit:

**Unpaved Shoulder Miles** 

#### **ROADSIDE**

#### 2110 Roadway Sweeping

Sweeping paved roadway surfaces, including parking areas, intersections and curb and gutter to remove dirt, sand and other debris

Work Unit:

Lane Miles

Inventory Unit:

Paved Roadway Lane Miles

#### 2120 Runway Sweeping

Sweeping paved runway surfaces, including taxiways and aircraft parking aprons to remove dirt, sand and other potential hazards to aircraft and personnel.

Work Unit:

Lane Miles

Inventory Unit:

Runway Lane Miles

#### 2130 Magnet Sweeping

Magnet sweeping of paved roadways and runways to remove metal debris from surface to allow safe operation of equipment and aircraft.

Work Unit:

Lane Miles

Inventory Unit:

Paved Surface Lane Miles

#### 2140 Machine Mowing

Tractor mowing of roadsides and designated grounds area to maintain an attractive roadside and grounds, provide adequate sight distance and control erosion and drainage.

Work Unit:

Acres

Inventory Unit:

Mowable Acres

#### 2150 Hand Mowing/Trimming

Mowing and trimming areas, such as medians, steep slopes and other areas not accessible to tractors, with walk-behind mowers and other hand tools to maintain the vegetation and to control erosion and drainage.

Work Unit:

Person Hours

Inventory Unit:

Mowable Acres

#### 2160 Spraying/Weed Control

Application of chemicals to vegetation and soil to eliminate undesirable growth or control growth in areas inaccessible to mowers, such as around guardrails, signs, fences, bridge ends, drainage ditches and other designated areas.

Work Unit:

Person Hours

Inventory Unit:

Mowable Acres

#### 2170 Reseeding and Sodding

Reseeding and sodding of roadsides and grounds areas to restore vegetation for erosion control and appearance.

Work Unit:

Square Yards

Inventory Unit:

Mowable Acres

#### 2180 Erosion Control

Repair of erosion and failures on slopes to restore stability and the removal and disposal of eroded material.

Work Unit:

Person Hours

Inventory Unit:

Mowable Acres

#### 2190 Litter Pickup

Pickup and disposal of litter, trash and other debris on roadsides, parking areas and other designated areas for aesthetic value, and to remove unsightly or hazardous objects that may obstruct drainage or damage mowing equipment or personnel.

Work Unit:

**Bags Litter** 

Inventory Unit:

**Grounds Acres** 

#### 2200 Brush/Tree Cutting

Cutting and removing brush and trees within the right-of-way and other areas to restore sight distances, eliminate traffic hazards and remove encroaching vegetation.

Work Unit:

Person Hours

Inventory Unit:

**Grounds Acres** 

#### 2210 Repair Fences

Straightening and repair of broken or damaged fencing around government facilities to provide safety and security.

Work Unit:

Linear Feet

Inventory Unit:

Linear Feet Fence

#### 2220 Clean Grit Chambers

Cleaning and removal of dirt, gravel and other debris from grit chambers of motor pool washracks.

Work Unit:

Person Hours

Inventory Unit:

Number Wash Racks

#### 2230 Remove Roadway Debris

Removal of roadway debris due to vehicle accidents and storm damage to provide safe use of the roadway.

Work Unit:

Person Hours

Inventory Unit:

Roadway Miles

#### **DRAINAGE**

#### 3110 Clean/Reshape Ditches

Cleaning and reshaping of roadside ditches along paved surfaces. Includes the removal, hauling and disposal of excess material to restore the original grade line and to ensure adequate drainage.

Work Unit:

Ditch Miles

Inventory Unit:

**Unpaved Ditch Miles** 

#### 3120 Clean Culverts/Inlets

Cleaning and removal of debris and silt as required from box culverts, drain pipe culverts, inlets, and storm sewers to maintain adequate drainage and prevent flooding.

Work Unit:

Number Culverts/Inlets

Inventory Unit:

Number Cuiverts/Inlets

#### 3130 Repair/Replace Culverts

Repair or replacement of pipe culverts, drop inlets, catch basins and manholes to provide proper drainage. Includes the repair of headwalls and sand bagging of culvert ends to prevent erosion and washouts.

Work Unit:

Number Culverts/Inlets

Inventory Unit:

Number Culverts/Inlets

#### 3140 Place Riprap

Placing or replacing riprap on embankments and around bridges and drainage structures to prevent erosion and other failures.

Work Unit:

Person Hours

Inventory Unit:

Unpaved Ditch Miles

#### 3150 Clean/Clear Canals

The machine cleaning and reshaping of canals and non-roadway drainage ditches including the removal, hauling and disposal of excess material and sludge to restore the original grade line and to ensure adequate drainage at all times.

Work Unit:

Linear Feet

Inventory Unit:

Canal Miles

#### **BRIDGE SURFACE**

#### 4110 Clean Bridge Surface

Cleaning of bridge decks and bearing surfaces to remove sand and other debris, including the cleaning of expansion joints, drain holes and curbs.

Work Unit:

Square Yards

Inventory Unit:

Square Yards Bridge Deck

#### 4120 Repair Timber Deck

Repair and replacement of timber deck components to restore or preserve structural stability and smooth riding surface.

Work Unit:

Square Yards

Inventory Unit:

Square Yards Timber Deck

#### 4130 Repair Bridge Deck

Repair and patching of portland cement concrete and asphalt concrete bridge deck surfaces to maintain or restore structural stability and smooth riding surface.

Work Unit:

Square Yards

Inventory Unit:

Square Yards Non-Timber Deck

### TRAFFIC SERVICES

5110 Traffic Line Striping

Striping the centerline, edge and lane markings on paved surfaces for traffic, parking and pedestrian control.

Work Unit:

Linear Feet

Inventory Unit:

Traffic Line Miles

5120 Repair Signs

Repair, replacement and straightening of traffic signs, sign posts, delineators and other signs damaged by accident, vandalism, or deterioration to restore and maintain adequate control and guidance of traffic.

Work Unit:

**Number Signs** 

Inventory Unit:

**Number Traffic Signs** 

5130 Repair Guardrail

Repair of damaged or deteriorated guardrail/guiderail sections and posts to provide save driving conditions.

Work Unit:

Linear Feet

Inventory Unit:

Linear Feet Guardrail

5140 Repair Lights

Routine servicing, maintenance and repair of roadway lighting, tunnel or parking area lights to provide adequate lighting to high density vehicular use and parking areas.

Work Unit:

**Number Lights** 

Inventory Unit:

**Number Lights** 

5150 Repair Signals

Routine servicing, maintenance and repair of traffic signals and associated equipment to correct or prevent signal malfunction and to return signal to service.

Work Unit:

**Number Signals** 

Inventory Unit:

Number Signals

### **SNOW AND ICE CONTROL**

6110 Plow Roadways

Plowing of snow from roadways and parking areas to provide access and reduce hazardous driving conditions.

Work Unit:

**Roadway Miles** 

Inventory Unit:

Roadway Miles

6120 Plow Runways

Plowing of snow from runways, taxiways, heliports and aircraft parking aprons to provide for safe aircraft operations and to reduce hazardous operating conditions.

Work Unit:

Person Hours

Inventory Unit:

**Runway Lane Miles** 

6130 Rotary Snow Removal

Removal of heavy snow accumulations from runways and other areas when it is required to remove the snow from the area being plowed or to load the snow into trucks for disposal.

Work Unit:

Person Hours

Inventory Unit:

Paved Surface Lane Miles

6140 Load/Haul Snow

Loading and hauling snow from windrowed snow, rotary plow operations or other areas when the snow must be hauled to a disposal site.

Work Unit:

Person Hours

Inventory Unit:

Paved Surface Lane Miles

6150 Sweep Snow from Runways

Sweeping runways to remove snow and slush from the pavement surface throughout the snowfall duration to maintain the center of the runway in a bare pavement

Work Unit:

Person Hours

Inventory Unit:

Runway Lane Miles

6160 Apply Chemicals/Abrasives for Ice Control

Application of approved chemicals and/or abrasives to runways, taxiways, roadways, parking areas and hazardous locations to remove ice and provide for safe vehicle and aircraft operations.

Work Unit:

Person Hours

Inventory Unit:

Paved Surface Lane Miles

6170 Clear Snow and Ice from Runway Lights

Clearing snow and ice from runway edge lights to maintain visibility and provide runway clearance for aircraft movement and safe operations.

Work Unit:

**Number Lights** 

Inventory Unit:

**Number Runway Lights** 

6180 Clear Walkways

Removal of snow and ice from sidewalks and other walkways to provide safe passage and use for personnel.

Work Unit:

Linear Feet

Inventory Unit:

Linear Feet Sidewalk

6190 Install/Remove Snow Fence

Installation and removal of snow fences at selected locations to minimize and reduce the effect of snowdrifts on roadways and runways.

Work Unit:

Linear Feet

Inventory Unit:

**Number Locations** 

6200 Install/Remove Snow Markers

installation and removal of snow markers to identify the location of airfield lighting systems and other potential snow plowing obstacles.

Work Unit:

Number Markers

Inventory Unit:

**Number Locations** 

### APPENDIX B: PLANNING GUIDELINES

### U.S. ARMY CORPS OF ENGINEERS Maintenance Management System

### LIST OF PLANNING GUIDELINES

|      | <u>Title</u>                   | <u>Page</u>  |
|------|--------------------------------|--------------|
| 1110 | Pothole Patching               | B-3          |
| 1120 | Partial-Depth Patch            | B-5          |
| 1130 | Full-Depth Patch               | B-7          |
| 1140 | Surface Treatment Patch        | B-9          |
| 1150 | Surface Treatment              | B-11         |
| 1160 | Skid Resistance Treatment      | B-13         |
| 1170 | Crack Sealing                  | B-15         |
| 1180 | Treat Bleeding Asphalt         | B-17         |
| 1190 | Treat Fuel Spillage            | B-19         |
| 1310 | Bituminous Patching of PCC     | B-21         |
| 1320 | Partial-Depth Patch of PCC     | B-23         |
| 1330 | Full-Depth Patch of PCC        | B-25         |

| 1380 | Slabjacking                    | B-35         |
| 1390 | Slab Grinding                  | B-37         |
| 1400 | Surface Grooving               | B-39         |
| 1510 | Blade Unpaved Surface          | B-41         |
| 1520 | Add Gravel to Unpaved Surface  | B-43         |
| 1530 | Cement/Lime Stabilization      | B-45         |
| 1540 | Dust Control                   | B-47         |
| 1550 | Blade Troop Trails             | B-49         |
| 1710 | Patch Paved Shoulder           | B-51         |
| 1720 | Seal Coating                   | B-53         |
| 1730 | Blade Unpaved Shoulder         | <b>B</b> -55 |
| 1740 | Add Gravel to Unpaved Shoulder | <b>B</b> -57 |
| 2110 | Roadway Sweeping               | B-59         |
| 2120 | Runway Sweeping                | B-61         |
| 2130 | Magnet Sweeping                | B-63         |
| 2140 | Machine Mowing                 | <b>B</b> -65 |
| 2150 | Hand Mowing/Trimming           | B-67         |
| 2160 | Spraying/Weed Control          | <b>B</b> -69 |
| 2170 | Reseeding and Sodding          | B-71         |
| 2180 | Erosion Control                | B-73         |
| 2190 | Litter Pickup                  | B-75         |
| 2200 | Brush and Tree Cutting         | B-77         |
| 2210 | Repair Fences                  | <b>B</b> -79 |
| 2220 | Clean Grit Chambers            | B-81         |

|      | <u>Title</u>                              | <u>Page</u> |
|------|---|-------------|
| 2230 | Remove Roadway Debris                     | B-83        |
| 3110 | Clean/Reshape Ditches                     | B-85        |
| 3120 | Clean Culverts/Inlets                     | B-87        |
| 3130 | Repair/Replace Culverts                   | B-89        |
| 3140 | Place Riprap                              | B-91        |
| 3150 | Clean/Clear Canals                        | B-93        |
| 4110 | Clean Bridge Surface                      | B-95        |
| 4120 | Repair Timber Deck                        | B-97        |
| 4130 | Repair Bridge Deck                        | B-99        |
| 5110 | Traffic Line Striping                     | B-101       |
| 5120 | Repair Signs                              | B-103       |
| 5130 | Repair Guardrail                          | B-105       |
| 5140 | Repair Lights                             | B-107       |
| 5150 | Repair Signals                            | B-109       |
| 6110 | Plow Roadways                             | B-111       |
| 6120 | Plow Runways                              | B-113       |
| 6130 | Rotary Snow Removal                       | B-115       |
| 6140 | Load/Haul Snow                            | B-117       |
| 6150 | Sweep Snow from Runways                   | B-119       |
| 6160 | Apply Chemicals/Abrasives for Ice Control | B-121       |

### PLANNING GUIDELINE U.S. Army Engineering & Housing Support Center Pavement Maintenance Management WORK ACTIVITY Full-Depth Patch of PCC Surface APPROVED EFFECTIVE SUPERSEDES CODE 1330

### DESCRIPTION

Removal and replacement of large (more than 25 sq. ft.) areas of failed portland cement concrete (PCC) surfaces and base courses as required to provide a smooth, structurally sound surface and  $\alpha$  eliminate safety hazards.

# PLANNING GUIDELINE U.S. Army Engineering & Housing Support Center Pavement Maintenance Management WORK ACTIVITY Surface Grooving APPROVED EFFECTIVE SUPERSEDES CODE 1400

### DESCRIPTION

Grooving portland cement concrete pavements by cutting a series of small grooves or cuts in the pavement surface to improve the surface skid resistance.

# PLANNING GUIDELINE U.S. Army Engineering & Housing Support Center Pavement Maintenance Management WORK ACTIVITY Patch Paved Shoulders APPROVED EFFECTIVE SUPERSEDES CODE 1710

### DESCRIPTION

Patching of paved shoulders with asphalt concrete material to correct abrupt depressions, edge failures and other potential surface hazards to provide a smooth paved surface.

| MAINTENANC           |     | Paved Shoulder Mile |     |     |     |     |     |     |     |     |     |     |

| 1. Visually inspect walkways and sidewalks to determine areas warranting work.  2. Sweep and shovel entry ways and handicap ramps as snow accumulates.  3. Use power equipment to remove snow and push to areas for removal.  4. Perform hand sweeping or ice removal as necessary on remaining ice and snow.  5. Treat icy areas with sand/abrasives. |          |
